

Roblox Experience / Game Design Document

Dismantle (Working Title)

A cooperative game where up to 4 players carve down a gigantic kaiju corpse until it is flat.

The structure of a “flatten the mountain” game is reworked as kaiju dismantling. Players start carving with a handheld cutter, then use the money they earn to level up drones and turrets, automating and accelerating the dismantling process. Eggs discovered while carving can contain rewards or rampaging enemies. Enemies can be defeated with weapons or even the starter cutter.

Figure 01. Scale composition concept (replaced in v0.2)

Kaiju = mountain. Players are tiny dots at its foot; carved terraces become work surfaces. Drones, turrets, eggs, UFOs, and gas are placed around the body. The octopus type is only a candidate example; numbers and UI are provisional.

Item	Details
Document type	Planning / game design reference document
Version and date	v0.2 Feature Expansion / September 10, 2026 (revision of the v0.1 visual organization version)
Previous title	<i>Kaiju Disposal Squad (Working Title)</i> . Changed in this version to <i>Dismantle (Working Title)</i> .
Platform	Roblox
Players	Up to 4 players in one party
Intended readers	Planning, development, art, and sound teams
Status	Concept organization stage. Values, implementation methods, and workload are not yet finalized.

This document organizes the provided concept proposal and additional instructions. It does not show implemented game screens or guarantee that all features can be produced within a short period.

0 How to Read This Document

Document guide and status

This document is used to share the game's central play experience, the role of each system, and the scope covered here. Read it by distinguishing adopted design directions from candidates and items that are still undecided.

Notation	Meaning
[Direction]	A direction stated in the provided concept proposal or additional instructions. It does not mean implementation is complete.
[Candidate]	An example that may be adopted. It does not mean every type will be implemented or that a progression order is fixed.
[Unconfirmed]	An item that still requires a planning or implementation decision. Do not invent numeric values.
[Illustrative Mockup]	A diagram or screen example used to explain the experience. Position, colors, UI, and numeric values are not final specifications.
v0.2 Added (yellow box)	A direction newly added in this version, used as a marker to track differences from the previous version.

Content reflected in this version

1. The title was changed to *Dismantle (Working Title)*. **2.** The base structure is explicitly defined as a "flatten the mountain" style game, and the main progression axis is placed on leveling up drones and turrets. **3.** Audio direction is now a dedicated item, including satisfying carving ASMR and strange sounds when gas appears. **4.** Treasure chests are replaced by eggs whose contents change randomly every time: items, money, or enemies. **5.** Being able to attack enemies with weapons is clearly stated as a point of differentiation. Ray guns and bazookas are prepared as weapon concepts, while the starter cutter can still deal damage.

The v0.1 elements are retained: gas masks, parasitic mini-kaiju, UFOs, BOX-style avatars, cubic kaiju, and a shared 100% dismantling completion goal. The first kaiju type is still not selected.

1 Concept and Core Loop

Concept and core loop

1.1 The concept in one sentence

Up to 4 players carve a mountain-sized kaiju corpse flat. They carve by hand, earn money, and improve drones and turrets to accelerate dismantling. Eggs exposed during the process can be lucky or unlucky, and hostile enemies from a bad result are defeated with weapons.

v0.2 Added. The base structure is the “flatten the mountain” type of game. The kaiju corpse is gigantic terrain that players can stand on and carve. Changing the kaiju type is equivalent to taking on a mountain with a different shape.

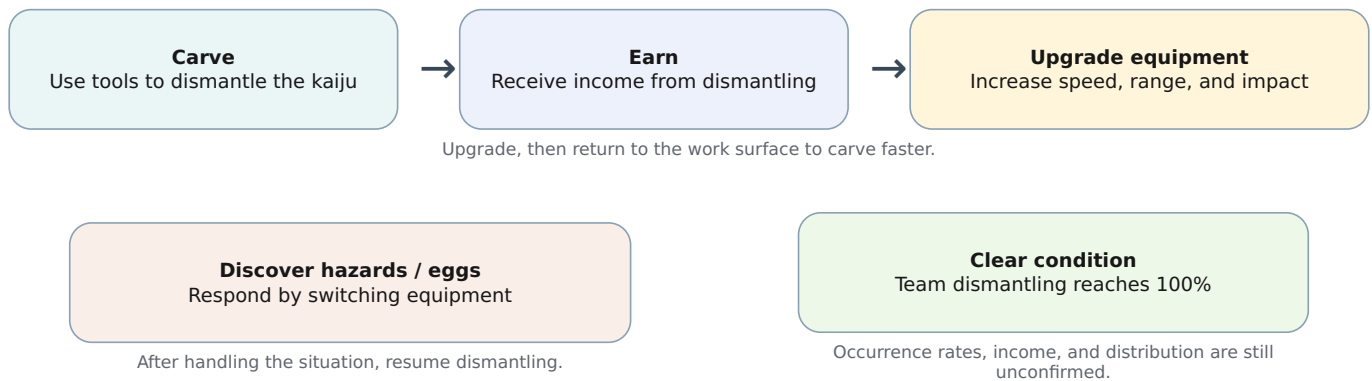

Figure 02. Core loop (reused from the v0.1 diagram). In this version, “upgrade equipment” includes leveling up drones and turrets.

1.2 Flow of one play session

1. A party of up to 4 players enters the dismantling site of a gigantic kaiju.
2. Players carve the kaiju with handheld cutters or chainsaws. Every successful carve generates income.
3. Income is used to buy and level up drones and turrets, increasing the amount dismantled automatically.
4. Eggs are discovered while carving. Opening one produces an item, money, or an enemy.
5. If enemies, UFOs, or gas appear, players switch to weapons or masks, deal with the event, and return to work.
6. The session is cleared when the team’s dismantling rate reaches 100%.

1.3 Center of the experience

The core feeling comes from seeing carved areas physically disappear, including the sound feedback; from clearly feeling the dismantling speed increase as drones and turrets level up; from the anticipation of not knowing what an egg contains; and from the chaotic fun when enemies appear. From start to finish, the goal is to raise the kaiju’s dismantling rate to 100%.

[Unconfirmed] Target play-session length, income calculation method, and how earnings are distributed within the team.

2 Growth of Dismantling Methods: Handheld Tools, Drones, and Turrets

Cutting tools, drones and turrets

v0.2 Added. The main progression axis is leveling up drones and turrets. Handheld tools remain as the “first way to carve” and as tools that can also hit enemies.

2.1 Three dismantling methods

Method	Role	How it grows	Positioning
Handheld tools (cutter, chainsaw, etc.)	Applied directly by the player. Main early-game method. Also damages enemies (see Section 5).	Upgrade to stronger tools [Candidate] , such as a plasma cutter.	Starter equipment. Can stay useful until late game, but should not become the main source of total dismantling.
Drone	Flies around the player or a designated area and carves automatically.	Level-ups may increase dismantling speed, number of drones, and range [Candidate] .	Main progression axis. Expected to contribute a large share of automated output and earnings.
Turret	A placed device that continuously carves the area around it.	Level-ups may increase dismantling speed, range, and number of placements [Candidate] .	Main progression axis. Can handle high or recessed areas the player cannot easily reach.

2.2 Income and upgrades

Income earned from dismantling becomes the funding source for leveling up drones and turrets and for purchasing tools, masks, and weapons. Drone and turret upgrades should create an obvious visual increase in speed. Tool upgrades should improve hands-on feel, masks should improve visibility, and weapons should improve enemy handling.

2.3 Drones, turrets, and cooperative play

[Unconfirmed] Whether drones and turrets are individually owned or shared by the team. If each player owns them, automated dismantling from four players can run at the same time, directly affecting the rate of progress and income distribution design.

2.4 Design considerations

- If handheld-tool damage against enemies (Section 5) is too high, there will be less reason to upgrade tools or buy weapons. The direction is: handheld tools can defeat enemies, but slowly; weapons should be faster, safer at range, and capable of hitting aerial targets.
- If automated dismantling becomes too strong, players will simply wait. Egg discoveries and enemy responses should function as reasons for players to actively participate by hand.
- It is still undecided whether turrets only carve the kaiju or also shoot enemies. If they do both, turrets risk replacing the weapon category and reducing the reason to buy weapons.

[Unconfirmed] Drone/turret level count, prices, dismantling speed, range, unit/placement limits, whether turrets attack enemies, and whether equipment or money carries over into the next play session.

3 Gas, Gas Masks, and Audio

Gas hazards, visibility and audio

[Direction] Gas is released from inside the kaiju during dismantling. Players prevent its effects by equipping a gas mask from the inventory.

Figure 03. Example response during a gas event (reused from v0.1). Visibility limits, egg shape, HUD, and numeric values are illustrative only.

State / equipment	Response to gas	Visibility change
No mask	The player is affected by the gas.	Work can be performed with the normal field of view.
Basic gas mask	Simply equipping it blocks the gas.	The view becomes narrow and harder to see through.
Advanced gas mask	Blocks the gas.	Provides a wider view and an infrared-like display, making it easier to see in the gas.

3.1 Audio direction

v0.2 Added. Use sound to make carving feel satisfying (ASMR direction). When gas appears, use a “strange sound” to signal the abnormal event while creating both humor and tension.

Situation	Audio direction [Candidate]	Goal
Carving by hand	Blade-entry sounds, blocks crumbling away, and cut surfaces chipping. Repeated carving layers these sounds in a satisfying rhythm.	Strengthen tactile feedback through audio. Also suitable for short video / streaming clips.
Drones / turrets carving	Multiple small, light carving sounds. As levels rise, the sound density increases.	Let players hear that the operation has become faster.
Income / level-up	Coin sounds and short success cues.	Clearly mark progression milestones.
Gas appears	Deflating, bubbling, or “pssh” sounds leaking from inside the kaiju.	Treat it as a weird event rather than pure horror, and prompt players to switch to a mask.
Egg found / opened	Cracking sound, followed by either a positive cue or a cry / alarm depending on the result.	Extend anticipation about what will come out.
Enemy appears	Baby-kaiju cries, and electronic sounds for aliens and UFOs.	Communicate the shift from work to combat.

3.2 Gas and enemies at the same time

Later in the session, gas and enemies may occur simultaneously. Players defend against the gas with a mask while using weapons against enemies that are harder to see. A design where this always happens at fixed dismantling percentages has **not** been adopted.

[Unconfirmed] Gas effects, area, duration, frequency, mask prices, and the audio-asset production method (original production, purchased assets, or generated assets).

4 Eggs: Randomized Rewards and Enemy Spawns

Eggs as randomized loot

v0.2 Added. Replace the treasure chests used in “flatten the mountain” games with eggs. Players do not know the contents until an egg is opened, and the result changes randomly every time. A good result gives items or money; a bad result spawns aliens or baby kaiju that rampage around the work area.

4.1 How eggs appear

As the kaiju is carved, eggs buried inside the body are exposed. They can be revealed by handheld tools, drones, or turrets. Once exposed, an egg may remain in place until someone chooses to open it **[Candidate]**.

4.2 Outcome categories

Category	What happens on the spot	Design role
Money	The player's funds increase. A large lump sum or multiplier bonus is possible [Candidate] .	A lucky result that can effectively skip one upgrade step.
Item	Equipment, consumables, temporary buffs, and similar rewards may be obtained [Candidate] .	A lucky result that brings equipment progression forward.
Baby kaiju	Hatches from the egg, rampages nearby, and attacks players. It can be defeated with a weapon or cutter. Defeat reward is [Unconfirmed] .	Creates an immediate combat interruption.
Alien	Appears from the egg and attacks players. Whether it is linked to calling in a UFO is [Unconfirmed] .	Creates a reason to use long-range weapons such as the ray gun.

4.3 The experience created by eggs

Eggs create the expectation of “what will come out?” and the chaotic fun of a hostile result suddenly jumping into the work area. They also create a shared moment where teammates watch the outcome together. Because the same-looking egg can produce a different result every time, eggs support replay motivation.

4.4 Design considerations

- If the bad-result ratio is too high, refusing to open eggs becomes the rational choice. The expected value should make opening eggs beneficial overall.
- The direction is that reward eggs and enemy eggs are not visually distinguishable. However, an upper-tier mask could potentially reveal the contents with an infrared-like view, turning “a way to tell them apart” into a reward **[Candidate]**.
- If the player who opens an egg and the player who receives its reward are different, the rules can strongly affect the cooperative atmosphere.

[Unconfirmed] Result categories and probabilities, egg appearance rate, opening interaction, who receives spawned items, and enemy defeat rewards. Pet raising is outside the scope of this version.

5 Enemies and Weapons: Aliens, Baby Kaiju, and UFOs

Enemies and weapons

v0.2 Added. A key difference from “flatten the mountain” is that enemies can be attacked and defeated with weapons. Enemy-focused weapons such as ray guns and bazookas are planned, while mining tools such as the starter cutter must still deal real damage.

5.1 Enemy types

Enemy	Source	Behavior [Candidate]
Baby kaiju	Egg (Section 4)	Rampages on the ground and targets nearby players or placed turrets.
Parasitic mini-kaiju	Inside the kaiju while carving	Small and numerous. Harder to see if they appear at the same time as gas.
Alien	Egg or invasion event	Attacks from range.
UFO	Invasion event	Attacks from the air and can be shot down.

5.2 Roles of weapons and tools

Weapon / tool	Intended use	Strengths and weaknesses [Candidate]	Unconfirmed
Cutter / chainsaw (starter tool)	Defeat nearby enemies	Available without purchase. Deals damage, but slowly. Requires close range and cannot hit aerial enemies.	Damage ratio versus weapons
Standard gun	Basic attack against ground enemies	Easy to use.	Range, damage, ammo, price
Ray gun	Aliens and distant enemies	Long range and rapid fire.	Damage, ammo, price
Bazooka / launcher	UFOs and enemy groups	Area attack and anti-air capability, but low ammunition.	Blast radius, ammo, price

5.3 Why starter tools must still be able to defeat enemies

Players who have not purchased a weapon, or who join a session midway, should never be unable to contribute against enemies. The value of weapons should not be “can defeat / cannot defeat.” Their value should be “faster, farther away, can hit aerial targets, and can handle groups.”

5.4 Design considerations

- If starter-tool damage already feels sufficient, players will not buy weapons. Weapons should improve combat tempo and safety, while starter tools remain a “you can win if you take enough time” option.
- Aerial enemies such as UFOs cannot be reached with starter tools. Keeping a small number of enemies that the starter tool cannot defeat creates a natural reason to buy weapons.
- If turrets are allowed to shoot enemies, their role overlaps with weapons (see Section 2).

[Unconfirmed] Enemy counts, health, appearance frequency, spawn conditions, shoot-down rewards, whether every weapon candidate will be adopted, and whether any weapons are exclusive to specific enemies.

6 Kaiju and Screen Design

Kaiju terrain and visual direction

Target	Direction adopted in this version
Avatar	Always use a BOX-type Roblox-style avatar. Torso, arms, and legs should fundamentally be box-shaped.
Kaiju	Built from angular cubes in a Minecraft-like style. Contours and carved cross-sections should show visible steps.
Drones / turrets	Use the same cubic visual vocabulary as the kaiju. Higher levels may make them larger and flashier [Candidate] .
Eggs	A rounded form built by stacking cubes. The result category should not be visually distinguishable (see 4.4).
World	A bright, simple, “brainrot-style” screen similar to the sneaker reference material.
Readability	Make the kaiju, work areas, teammates, enemies, and eggs easy to distinguish. Use large shapes and strong colors rather than realistic surface detail.

6.1 The kaiju is gigantic terrain

Use the overwhelming scale and strange forms seen in works such as *Pacific Rim* and *Gamera* only as directional references, then design an original kaiju. Shape candidates include a super-giant octopus, super-giant squid, and super-giant hermit crab. This does not mean all three must be implemented in the initial version.

[Unconfirmed] The first kaiju to implement, its total scale, cube size, and the unit that can be carved away.

7 Cooperative Play and Interface Outline

Cooperative play and interface outline

[Direction] The team shares the dismantling rate of one kaiju and works toward 100%. There are no fixed classes; players switch equipment according to the situation.

Situation	Example of cooperation
Normal work	Four players carve different areas while each player's drones and turrets also work in parallel.
Egg discovered	Decide who opens it and whether to ready weapons first. Teammates watch the outcome together.
Enemy appears	Nearby teammates switch to weapons and defeat it. Players without weapons assist with cutters.
Gas appears	Equip masks and continue working. The strange sound alerts everyone to the event.
UFO invasion	Players carrying bazookas or ray guns aim at the sky.

7.1 Information that the screen must communicate [Illustrative Mockup]

Team-wide dismantling rate; ownership and switching of handheld tools, masks, and weapons; drone/turret levels and operating status; money and purchase / upgrade access; and notifications for gas, enemies, and eggs. Exact positions, buttons, and input methods must be decided before implementation.

7.2 Control-design considerations

The player must be able to use weapons while a gas mask remains equipped. If the three categories are treated as simple mutually exclusive equipment slots, combat during gas events will not work. Drone/turret actions such as placement, retrieval, and leveling should be accessible without stopping the main work flow.

[Unconfirmed] Mid-session joining/leaving, player-count scaling, treatment of downed teammates, purchase/upgrade locations and controls, and drone/turret ownership model (see 2.3).

8 Differences from “Flatten the Mountain” and Project Scope

Differences from the base structure, and scope

8.1 What is inherited from the base and what changes

Element	“Flatten the Mountain” structure	Handling in this project
Target to carve	Mountain (terrain)	A gigantic kaiju corpse. Different kaiju types create different shapes.
Main progression	Leveling up automated mining such as drones and turrets	The same. Handheld tools are starter / support equipment.
Random reward	Treasure chest	Egg. In addition to rewards, a bad result can spawn an enemy.
Enemy handling	Usually none (no enemies, or simply escape)	Enemies can be attacked and defeated with weapons. Starter tools still deal damage.
Environmental hazard	—	Gas, visibility restriction, and gas masks.
Audio	Work sounds	ASMR-style carving, strange gas-event sounds, and audio for eggs / enemies.
Clear condition	Flatten the mountain	Shared team dismantling rate reaches 100%.

8.2 Features covered in this planning scope

Feature	Role in the plan
Co-op party of up to 4 players	Players share the dismantling rate of the same kaiju.
Handheld dismantling and dismantling-rate display	Early-game method and visible progress feedback.
Buying and leveling drones / turrets	Main progression. Automates and accelerates dismantling.
Eggs (random rewards / enemies)	Replacement for treasure chests and a replay motivator.
Enemies (baby kaiju, parasitic mini-kaiju, aliens, UFOs) and weapons	Interruptions during work and a key point of differentiation.
Starter-tool enemy damage	Allows participation even without a weapon.
Gas and gas masks	Workplace hazard and visibility change.
Audio direction	Communicates tactile feedback, growth, abnormal events, and anticipation.
Clear at 100% dismantling	Clearly communicates completion of the work.

8.3 Out of scope and ideas not adopted for this version

Transporting remains, incineration / processing machines, a final core battle, city restoration, and pet raising (including keeping baby kaiju that hatch from eggs) are outside the current scope. A system with five separate dismantling states and a system that triggers events at fixed dismantling percentages are also not adopted. The block-based visual direction does not decide the internal implementation method.

8.4 Prototype scope and workload

This document does not promise that every listed feature can be implemented within a short production period. The prototype scope must be decided during production based on team capacity and existing assets. The full planning scope and the feature set of the first prototype should be managed separately.

9 Decisions and Open Items

Decisions and open items

9.1 Current planning direction

Title: *Dismantle (Working Title)*. The base is the “flatten the mountain” structure. Up to 4 players share one dismantling rate and clear the session at 100%, with no fixed roles. The main progression axis is leveling up drones and turrets. Treasure chests are replaced by eggs whose contents are random every time, producing either a reward or an enemy. Enemies can be defeated with weapons, and even the starter cutter deals damage. Gas, masks, and UFOs are retained. Audio uses ASMR-style carving sounds and strange noises during gas events. The art direction is unified around BOX-type avatars, cubic kaiju, and a bright brainrot-style presentation.

9.2 Items to decide next

Topic	Decision required
Title	Whether “Dismantle” becomes the official title. Confirm English naming and searchability on Roblox.
Initial kaiju	Shape and scale. Octopus, squid, and hermit crab are candidates.
Drones / turrets	Number of levels, price, dismantling speed, range, unit count, individual vs shared ownership, and whether turrets shoot enemies.
Handheld tools	Number of types and prices, dismantling speed, enemy damage, and damage ratio versus weapons.
Weapons	Number of types, damage, range, ammunition, prices, and which enemies cannot be defeated with starter tools.
Eggs	Probability by result category, appearance rate, opening interaction, reward ownership, and enemy defeat rewards.
Enemies	Health, count, frequency, spawn conditions, and whether baby kaiju and parasitic mini-kaiju remain separate or are merged.
Gas	Effects, area, duration, frequency, and mask prices.
Audio	Asset-production method and references for the ASMR-style carving direction.
Play time / income	Target session length, player-count scaling, income calculation, and distribution inside the team.
Down / failure	What happens when a player is downed, revival method, and whether a failure condition exists.
Carryover	Whether drone/turret levels, equipment, and money carry over into the next session.
Implementation / prototype	Carving unit, implementation method, prototype feature set, and workload.

9.3 What the prototype should verify [Validation proposal]

1. Does carving by hand feel satisfying, including the audio, and is it easy to understand that the whole kaiju is gradually disappearing?
2. Do drone and turret level-ups clearly feel faster, without creating long periods where the player simply waits?
3. Does the motivation to open eggs remain strong even after several bad results?
4. Can a player with only the starter cutter still participate against enemies, while still wanting to buy a weapon?
5. Can multiple players carve at the same time, and after responding to an event, do they naturally want to return to dismantling?

Target values such as play time and event probabilities are not set at this stage. Use prototype results to tune them jointly between the planning and development sides.

Source: User-provided *Kaiju Disposal Squad (Working Title) Concept Proposal v0.1* and the v0.2 additional instructions (title, drone/turret direction, audio direction, eggs, and weapon policy). Layout reference: *STEAL A SNEAKER Planning Document v0.3*. The images reuse concept art generated for v0.1; they are not in-game screenshots and do not show the elements newly added in v0.2.
